Replacing older covers in communal spaces

Coverad is helping an independent nursing-home group replace older LST and wooden radiator covers with more robust Eazi-Access casings. Work completed so far covers communal areas in three properties, including corridors, dining rooms and lounges.

The group selected Eazi-Access for hard-wearing casings and practical access for cleaning, inspection and maintenance. The programme remains ongoing.

Practical details for everyday care

Access fixing and ventilation detail.

A wider view of the same window installation.

Eazi-Access: upkeep in mind

The steel casings provide a robust replacement for the older covers. Controlled access allows authorised teams to reach the radiator and the space behind the casing for routine cleaning and maintenance.

30° sloping tops where space allows

A 30° sloping top discourages the cover being used as a shelf, helping reduce the likelihood of items obstructing airflow. The profile is selected around window sills and nearby fittings. Furniture, curtains and everyday items still need to stay clear of ventilation openings.

The programme so far

Communal areas within three properties have been completed. The focus is on durable casings that are straightforward to maintain and clean, with ventilation and access considered at each location.

Reviewing your existing radiator covers?

Send photographs and a radiator schedule, or arrange a free site survey.
