

Bespoke radiator covers

Sandown Town Hall, Isle of Wight

Decorative steel panels integrated into the hall's timber framework.

QUANTITY

11 covers

MATERIAL

2mm steel

FINISH

RAL 7023 paint

COMPLETED

September 2025

Designed alongside the consultant

The consultant required bespoke radiator casings installed within timber framework, with a decorative punched front matching period work already in the property. Coverad developed the design alongside the consultant for a local main contractor.

Each casing combines a bespoke 2mm steel front panel with a separate perforated top panel let into the timber for airflow. The metalwork was finished in special RAL 7023 paint.

Coverad surveyed, designed, manufactured, supplied and installed all 11 covers. The project was completed in September 2025.

The details that make it bespoke

Finished front: circular motif and decorative punching.

The 2mm steel panel in the workshop before finishing.

Inset top ventilation panel within the timber.

The panels coordinated with the surrounding joinery.

A coordinated metalwork and joinery arrangement

The completed installation follows the consultant's panel design and complements the hall's period detailing. The separate front and top panels address the decorative frontage and the ventilation opening within the timber construction.

Planning a bespoke casing?

Send drawings, radiator details and photographs to discuss your project.
